

PROBLEM / SOLUTION SHEET

NEW DISPLAY INCREASED VISIBILITY

Problem: A UK based firm specialising in food processing required a solution that would enable their maintenance teams to accurately set a torque wrench in fairly subdued and dimly lit environments.

There was a problem with inaccurate setting of traditional torque wrenches due to lack of light. In dimly lit environments, such as working underneath assembly lines, it can be difficult to clearly see the scale and accurately set the torque.

Solution: The Norbar ClickTronic® does not require the user to set a cursor on a graduated scale, something that is problematic in poor light. Instead ClickTronic® uses a bright and easy to read OLED display, providing the user with clear torque information which is clearly visible in dimly lit conditions. With several models, covering from 10 to 340N·m, to choose from there is a ClickTronic® that will meet your requirements. The display will indicate the exact torque value set by the mechanic and can be seen from any angle. All tools are accurate to $\pm 3\%$ of reading.
